

Insudiet develops, manufactures and markets diet food: its product range counts more than 60 varieties of protein enriched food. The company particularly cares about research, elaboration and quality control of products

"The Electronic Nose is a powerful tool that mimics human perceptions. As the human nose, it includes various sensors that allow to measure the "olfactive fingerprint" of tested products. Whereas human beings appeal to their memory to identify an odor, the electronic nose refers to a database set-up prior to analysis.

At Insudiet, this tool is used to:

- accurately and efficiently control sensory features of final products
- follow aroma ageing of products
- analyse flavor scalping due to packaging interactions
- find or confirm the origin of ingredients."
